Vein diagnostics

The Capio Mosel-Eifel-Klinik is among Germany's largest vein clinics. The clinic is a contractual partner to all statutory and private health insurance providers for the provision or care - and can co-ordinate financial aid. Please schedule your appointment for a preliminary exam by phone at +49 (0) 2674 940-0, or by e-mail: info.cmek@de.capio.com.

Insofar as you are insured by a statutory provider, please bring your health insurance card and / or a physician's referral for vascular surgery / phlebology and any available reports of previous related findings with you for your visit. The preliminary exam lasts approx. 1.5 hours - and is risk-free as well as pain-free. For this purpose, state-of-the art ultrasound- and infrared-based medical-engineering devices are available.

Three months after a vein surgery, an outpatient follow-up exam is conducted to ensure the success of the treatment.

Gentle and aesthetic therapies

At the Capio Mosel-Eifel-Klinik, we utilise all available therapeutic methods to treat varicose veins. Apart from well-proven methods which we have perfected to the highest degree, useful, new high-tech methods are also used. All interventions are carried out under gentle and completely risk-free local anaesthesia which has already been applied in more than 250,000 cases without any complication so far. If desired, the patient can be placed into a light, induced sleep for this purpose.

Regardless of which particular surgical procedure is applied to the treatment for eliminating impaired veins - patients regain their mobility immediately after the procedure. The applied surgical and anaesthetic techniques are not or only slightly stressful for the patient, and are therefore suitable for older patients as well.

Academic expertise

In co-operation with universities, we are involved in future-oriented studies which are accepted on the international level.

In comparison with centres worldwide, our scientific results - with a recurrence rate of 13 % (in terms of the recurrence of varicose veins as well as the lowest incidence of OR risks) - definitely rank at the top.
